

THE FIRST TRC-20 HYPER-DEFLATIONARY CURRENCY

Whitepaper

Updated 14th June 2020

## Table of Contents

I. Tron and Deflationary Currency	3
II. Bomb Limitations	3
III. Void Token	3
IV. Distribution	4
V. Team and Partnerships	5
VI. Legal Disclaimer	5
VII. Concluding Thoughts	5

## I. Tron and Deflationary Currency

Tron (TRX) was developed as a means of utilizing solidity-based smart contracts with much greater speed and efficiency than its father chain, Ethereum. Through strategic acquisitions and effective marketing, CEO Justin Sun has bolstered Tron into a serious contender among the highest value cryptocurrencies. It is currently one of the most-used blockchains for decentralized applications (dApps) and features the standardized token protocol TRC-20.

Meanwhile on Ethereum, another interesting phenomenon has been garnering attention: deflationary currency. Bomb was the first original ERC-20 token using this logic and was launched in February of 2019. The concept is simple: each time the token is transacted, 1% of the token is destroyed. Since launch, Bomb has managed to achieve a whopping \$13.5 million peak market capitalization. Naturally, clones have emerged with intent to piggyback on Bomb's success, however none have been able to reach similar prestige.

## II. Bomb Limitations

Despite the success of the Bomb experiment, members of its community were quick to point out the token's shortcomings. First, there are no clear motivating use cases that transact tokens besides simple sales. This makes the deflation rate of 1% very negligible; in its four month existence only 3.5% of the total supply has been burnt. Also, the lack of an `approveAndCall()` function makes it very difficult to be used for dApps as it requires multiple transactions. Being on the Ethereum network, these transactions can be slow and expensive. Finally, the Bomb token does not support decimals and instead makes a minimum of one Bomb burn mandatory for each transaction. Many speculate this will stunt its ability to appreciate in value as the supply decreases since one would need two Bomb tokens in order to transfer one successfully. In such case, the recipient would only receive half the sent value!

## III. Void Token

Void Token is our attempt to address the problems with Bomb Token and bring it to the Tron network. To start, Void fully supports dApps and has been programmed to make the experience fluid and seamless. Tron has fast, cheap transactions and is perfect for playing games. Currently, we have developed our own uni-swap inspired dex for users to utilise the deflationary nature of void. We strive to develop more dapps with incentives for holders to explore. Ideally, this will provide the motivation to transfer Void and ultimately reduce the overall token supply.

Furthermore, we have decided to use 3% as our deflationary rate. We are aware there will be some controversy regarding this decision but our lead mathematician firmly believes this is the best approach to the deflationary model. We want the whole lifecycle of Void to be a gripping, intense experience that rewards the strongest holders in the long run. How long will it be until the supply drops to 10% of the starting supply? Only time will tell.

Void has also fixed Bomb's decimal problem and can shrink indefinitely for its entire lifespan. We intend on keeping the project details fully transparent including the team holdings, airdrop criterias, promotional expenses, and everything that crypto developers usually try to keep in the dark. We are serious in our intent, and we hope you will welcome us into the Tron Ecosystem.

## IV. Token Distribution

90% of Void tokens will be airdropped for free or given out as part of promotional activities. In particular, 40% will be allocated to the official Void airdrops. The remaining 50% will be distributed through promotional activities such as community giveaways, seed prizes for dApps, and special partnerships/promotions as they arise. The remaining 10% will be allocated for Void team members.

## V. Team and Partnerships

The current Development team for Void consist of Two people: Sai - Void Community Developer and ERROR 404 (aka Jeff) - The Community Manager. We have a Working relationship from working together on past projects on tron and have plans to expand the Void project. In particular, we are looking to better incorporate other leading community projects with Void, to better the whole of the tron community overall.

## VI. Legal Disclaimer

We have no intention of conducting a public or private sale for Void tokens. All tokens will be distributed via airdrops, dApps, partnerships, and community rewards. Only purchase Void tokens on any exchanges at your own risk. The tokens are intended to be used for the dApp platform and, despite being deflationary, are not guaranteed to appreciate in value. Obey by your local jurisdiction's laws when regarding purchasing, transferring, or utilizing Void tokens in any way.

## VII. Enter the Void

“Of course, technology is not an exogenous force over which humans have no control. We are not constrained by a binary choice between acceptance and rejection. Rather, the decisions we make every day as citizens, consumers, and investors guide technological progress.”

-Klaus Schwab

We hope this whitepaper has fully expressed the intent of our token as an honest attempt to improve on the novel concept of deflationary cryptocurrency. While this code on its own may not change the world forever, we believe we can play a role in the bigger picture of legitimizing the use cases for cryptocurrency and expanding the current knowledge pool. We look forward to an exciting future and are grateful towards those who wish to join us!

Now, as you gaze into the abyss, what do you see?
